## General Information

**Background** Actin belongs to the actin family of proteins, which are highly conserved proteins that play a role in cell motility, structure and integrity. Alpha, beta and gamma actin isoforms have been identified, with alpha actins being a major constituent of the contractile apparatus, while beta and gamma actins are involved in the regulation of cell motility. All eukaryotic cells express Actin, which often constitutes as much as 50% of total cellular protein. Actin filaments can form both stable and labile structures and are crucial components of microvilli and the contractile apparatus of muscle cells.

**Immunogen** Polyclonal antibody is produced by immunizing animals with a synthetic peptide of Actin.

**Purification** Polyclonal antibody was purified by protein A affinity chromatography.
